

“ A RANGE OF SERVICES RELATING TO SUSTAINABLE CHEMISTRY ”

Envision Chemistry is a business offering a range of services relating to sustainable chemistry.

We can help industry develop and use sustainable approaches:

- ▷ **substitution of hazardous and environmentally-unfriendly chemicals** by substances designed or assessed on the basis of sustainability
- ▷ **investigating the properties of chemicals in the research phase**, so that large R and D expenditure does not turn into disappointment when regulatory work starts
- ▷ **valid application of predictive and molecular modelling methods**, particularly important before a chemical has even been made
- ▷ **guidance and training**; we can help you develop better knowledge of modern techniques through to regulatory compliance
- ▷ **green processes**; there is a need for integrated product and process improvement, with potentially large cost savings as a consequence.

We are a team of experts, who have been working independently as consultants in relevant disciplines for some years. Since 2004 we have come together as a team to offer an integrated system of support to clients interested in working towards improving the environmental profile of their product portfolio.

We are always pleased to visit potential clients to make a scientific presentation and for introductory discussions.
